

Spawning Salmon in West creek Headwaters and the fate of the beaver pond levelers
November 11th 2021

Spawning Coho salmon down stream of beaver pond levelers. This is the first year that spawning salmon have been noticed this far up stream.

Redds created to lay their eggs after fanning off the layer of sediment.

These pipes are designed to be under water, with a cage to prevent the beaver from plugging them up. The floating bulrushes with the help of a westerly wind, pushing down stream have rendered this engineered system to be in effect nonfunctioning!
